## Tire Rotating and the Benefits

***By getting your tires rotated, you'll maximize the life of the tires***. In every vehicle, the weight exerted on the rear and front axles differ. Since most cars feature front engines, the front wheels tend to wear fast compared to the rear. Don't forget that braking and steering still put pressure on the front wheels making them wear even more. Tire rotation not only helps to ensure even tread wear but also prolongs the life, enhances gas mileage and guarantees a comfortable ride. Tire rotating involves moving the wheels and tires of an auto from side to another. Whether you drive a Mercedes Benz or a BMW, [iAUTOHAUS](#) has ***experienced technicians who will rotate your tires*** from the back to the front, diagonally and left to right per the vehicle recommendations.

## How Often to Rotate Tires?

***Every vehicle has its own tire rotation frequency and pattern as recommended by the manufacturer***, usually after driving a given number of miles. Some car makers recommend rotating tires after changing your oil, which is usually after driving several thousand miles. Other models like BMW require an oil change after 15,000 miles, which would take a long time before rotating the tires. In that case, rotate tires after roughly 6 months.

## Signs You Need to Rotate Your Tires

There are telltale signs that your tires need rotating. Initially, you'll discover uneven wear on the tires. Measure the depth of the tread at different points on each of the four wheels, and if they are different, you need to get them rotated. Also, you might discover that the wheels in the front axle tend to wear faster than those in the rear axle meaning you'll need to rotate them. The final way to tell is to be keen on noise and vibrations notable when at different points in the vehicle.
