What is an Alignment?

Wheel alignment (sometimes called "tire alignment") is the adjustment of the parts of a vehicle's suspension system, to **set the wheels and tires at optimum angles to facilitate the best possible handling** while driving, minimize tire wear, and improve performance.

What are the Benefits of Proper Tire Alignment?

Keeping your tires properly aligned is important for a number of reasons that sometimes do not occur to car owners. Proper wheel alignment:

- Improves vehicle safety.
- Increases your fuel efficiency.
- Allows for a smoother driving experience.
- Reduces expensive repairs of suspension and steering parts due to uneven or premature wear.
- Helps avoid excessive wear of tires that leads to needing premature replacement.

How to Tell if a Car is Out of Alignment

There are visual and performance signs that provide good indicators that your vehicle's wheels may be out of alignment, including:

- **Steering Pulling Right or Left** — The vehicle pulls to one side or the other, requiring the driver to compensate by maintaining correction of the pulling while driving.
- **Uneven Tire Wear** — The outer or inner surface area of the tire that makes road contact is wearing faster than the rest of that part of the tire. Often, the uneven wear occurs on only one or two tires.
- **Steering Wheel is Positioned Off-Center** — While driving straight, the steering wheel is off to the right or left of the 12 o'clock position.

- **Shaking Steering Wheel** – The steering wheel may pulsate or shake, even on smooth roads, possibly causing the shaking to travel through the chassis and be felt through the seat.

Should I Get a Front or 4-Wheel Alignment?

Depending on your vehicle type, rear wheel adjustments may be possible. At our auto shop, there is not a significant difference between prices for front only or all four-wheel alignment service.

- **Front Wheel Alignment** – Many vehicle models don't have adjustable rear wheels. If yours does not, then you'll need only a front wheel alignment.
- **Four Wheel Alignment** – If adjustments for both front and rear wheel alignment are possible on your vehicle, then you should have a 4-wheel alignment.

How Long Does a Wheel Alignment Take?

On average, a wheel alignment takes around an hour. Although this is often considered a service that you can just drop in to have done, many auto service shops recommend scheduling an appointment. Especially in shops with just one alignment rack, or with very limited staff, waiting in line can cause your stay at the shop to be much longer than an hour.

How Often Should You Have an Alignment of Your Car's Tires?

There's no standard length of time that a vehicle should be expected to remain in alignment. ***It is generally recommended that you have your car aligned once or twice each year.*** However, if you drive on rough roads, or bump into curbs, you should have a more frequent re-alignment.
